

OSINT Email Enumeration using theHarvester (tesla.com)

Aim

To perform an OSINT-based enumeration of the domain tesla.com using theHarvester and collect publicly available emails, hosts, subdomains and IP addresses.

Step 1: Open Kali Linux

Boot Kali Linux and log in.

Step 2: Open Terminal

Press Ctrl + Alt + T.

Step 3: Verify Internet

Run:
`ping google.com`

Step 4: Check theHarvester

Run:
`theHarvester --help`
If not installed:
`sudo apt update`
`sudo apt install theharvester`

Step 5: Create Working Folder

```
mkdir OSINT-LAB
cd OSINT-LAB
```

Step 6: Run Enumeration

Initially:
`theHarvester -d tesla.com -b crtsh -f tesla_report`
No useful results were returned.
Then use:
`theHarvester -d tesla.com -b duckduckgo`

Step 7: Observed Output

```
Target: tesla.com
Searching DuckDuckGo
No IPs found
No emails found
No people found
Hosts found: 4
digitalassets.tesla.com
ir.tesla.com
```

Step 8: Save/View Reports

If using -f option:

```
ls
cat tesla_report.json
cat tesla_report.xml
```

Findings

Emails: None found

People: None found

IP Addresses: None found

Hosts/Subdomains: digitalassets.tesla.com, ir.tesla.com

Risk Analysis

Publicly exposed subdomains reveal information about an organization's infrastructure. Combined with other public sources, such information may assist reconnaissance and make phishing messages appear more convincing. No public email addresses were discovered in this assessment.

Recommendations

1. Minimize unnecessary public information.
2. Monitor OSINT exposure regularly.
3. Implement SPF, DKIM and DMARC.
4. Conduct employee security awareness training.
5. Secure and review public-facing assets regularly.

Screenshots to Include

1. theHarvester command execution.
2. Output showing hosts found.
3. Is command showing report files (if generated).
